Many Natural Language Processing (NLP) techniques have been applied in the field of Question Answering (QA) for understanding natural language queries. Practical QA systems classify a natural language query into vertical domains, and determine whether it is similar to a question with known or latent answers. Current mobile personal assistant applications process queries, recognized from voice input or translated from cross-lingual queries. Theoretically speaking, all these problems rely on an intuitive notion of semantic distance. However, it

is neither definable nor computable. Many studies attempt to approximate such a semantic distance in heuristic ways, for instance, distances based on synonym dictionaries. In this paper, we propose a unified algorithm to approximate the semantic distance by a well-defined information distance theory. The algorithm depends on a pre-constructed data structure - semantic clusters, which is built from 35 million question-answer pairs automatically. From the semantic measurement of questions, we implement two practical NLP systems, including a question classifier and a translation corrector. Then a series of comparison experiments have been conducted on both implementations. Experimental results demonstrate that our distance based approach produces fewer errors in classification, compared with other academic works. Also, our translation correction system achieves significant improvements on the Google translation results. by which the scientific community confirms the validity of a new scientific discovery is by repeating the research that produced it. When a scientific effort fails to independently confirm the computations or results of a previous study, some fear that it may be a symptom of a lack of rigor in science, while others argue that such an observed inconsistency can be an important precursor to new discovery. Concerns about reproducibility and replicability have been expressed in both scientific and popular media. As these concerns came to light, Congress requested that the National Academies of Sciences, Engineering, and Medicine conduct a study to assess the extent of issues related to reproducibility and replicability and to offer recommendations for improving rigor and transparency in scientific research. *Reproducibility and Replicability in Science* defines reproducibility and replicability and examines the factors that may lead to non-reproducibility and non-replicability in research. Unlike the typical expectation of reproducibility between two computations, expectations

about replicability are more nuanced, and in some cases a lack of replicability can aid the process of scientific discovery. This report provides recommendations to researchers, academic institutions, journals, and funders on steps they can take to improve reproducibility and replicability in science.
