Electrical Measurement and Control (WBSCTE) Until the nineteenth century, music occupied a marginal place in British universities. Degrees were awarded by Oxford and Cambridge, but students (and often professors) were not resident, and there were few formal lectures. It was not until a benefaction initiated the creation of a professorship of music at the University of Edinburgh, in the early nineteenth century, that the idea of music as a university discipline commanded serious consideration. The debates that ensued considered not only music's identity as art and science, but also the broader function of the university within education and society. Rosemary Golding traces the responses of some of the key players in musical and academic culture to the problems surrounding the establishment of music as an academic discipline. The focus is on four universities: Edinburgh, Oxford, Cambridge and London. The different institutional contexts, and the approaches taken to music in each university, showcase the various issues surrounding music's academic identity, as well as wider problems of status and professionalism. In examining the way music challenged conceptions of education and professional identity in the nineteenth century, the book also sheds light on the way the academic study of music continues to challenge modern approaches to music and university education. Advances in Parallel Computing series presents the theory and use of parallel computer systems, including vector, pipeline, array, fifth and future generation computers and neural computers. This volume features original research work, as well as accounts on practical experience with and techniques for the use of parallel computers. The volume includes a set of selected papers extended and revised from the 2011 International Conference on Mechanical Engineering and Technology, held on London, UK, November 24-25, 2011. Mechanical engineering technology is the application of physical principles and current technological developments to the creation of useful machinery and operation design. Technologies such as solid models may be used as the basis for finite element analysis (FEA) and / or computational fluid dynamics (CFD) of the design. Through the application of computer-aided manufacturing (CAM), the models may also be used directly by software to create "instructions" for the manufacture of objects represented by the models, through computer numerically controlled (CNC) machining or other automated processes, without the need for intermediate drawings. This volume covers the subject areas of mechanical engineering and technology, and also covers interdisciplinary subject areas of computers, communications, control and automation. We hope that researchers, graduate students and other interested readers benefit scientifically from the book and also find it stimulating in the process. The first book on the subject written by a practitioner for practitioners.

Progress in Water Technology, Volume 6: Instrumentation Control and Automation for Waste-Water Treatment Systems contains the proceedings of the International Association on Water Pollution Research Workshop on Instrumentation Control and Automation for Waste-water Treatment Systems, held in London in September 1973. Contributors review major advances that have been made in instrumentation control and automation of wastewater treatment. This volume consists of 70 chapters organized into six sections. The work of the Directorate General Water Engineering in the Department of the Environment in the UK and the Environmental Protection Agency in the United States with respect to promotion of instrumentation, control, and automation for wastewater treatment systems is first discussed. This discussion is followed by a chapter that describes the effects of water pollution legislation in The Netherlands on the selection of wastewater treatment plants and their consequences for consulting engineers regarding process, technical, and economical feasibility. A real-time water quality management system for a major river in Pennsylvania is also considered, along with effluent control and instrumentation in Europe. The chapters that follow focus on instrumentation and control problems in the design of a modern sewage works; installation of field equipment in automated process control systems; process control for biological treatment of organic industrial wastewaters; and the use of computers to control sewage treatment. This book will be of interest to authorities, planners, and policymakers involved in wastewater treatment and water pollution control.
