The Fauna of British India, Including Ceylon and Burma, Vol. 1 Dec 13 2021 Excerpt from *The Fauna of British India, Including Ceylon and Burma, Vol. 1: Published Under the Authority of the Secretary of State for India in Council; Moths* The material available for study has been almost complete as far as it exists, and the descriptions have been drawn up and the synonymy worked out, in the large majority of cases, from the types of the species, so that it is hoped that comparatively few errors will have crept in. No pains have been spared to compare as large a series of each species as was possible, and as most of the species were originally described from single specimens by their authors, who did not always make sufficient allowance for the variation that is known to exist amongst the Moths of Europe and other countries where they have been largely bred, the synonymy has been lengthy and difficult to unravel and though some may think that more has been done in uniting species than will be justified by a future study of the subject,

yet as the individual peculiarities of each form have been indicated this will but help to show their affinities. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

**Materials for a Carcinological Fauna of
India** Dec 21 2019 Excerpt from Materials for
a Carcinological Fauna of India: No. 5. The
Brachyura Primigenia or Dromiacea Orbits and
antennulary fossae may either be altogether
wanting, or there may be common orbito-
antennulary fossae into which the eyes and
antennules are both retractile. The antennal
peduncle consists of four separate joints,
and the antennal agellum is long. The
epistome is triangular or truncate-
triangular, and is well delimited from the
palate. The buccal cavern is quadrilateral,
but is usually broader in front than behind.
The external maxillipeds may be pediform, or
sub-pedi form, or completely opercular. The
last pair of legs are dorsal in position,
and, with few exceptions, are prehensile
slender and reduced in size, or even
sometimes rudiment ary. The penultimate pair

sometimes resemble the last pair. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. The Fauna of British India, Vol. 4 Oct 31 2020 Excerpt from The Fauna of British India, Vol. 4: Including Ceylon and Burma This the fourth volume of the Rhynchota in the 'Fauna of British India' series deals with the Membracidae, Cercopidae, and Jassidae, the last a most obscure family of Homoptera, and the Appendix (which has been commenced) includes such species of the Pentatoraidae, Coreidae, and Berytidae as have been added to the Indian Fauna since the publication in 1902 of Vol. I. of the

Rhynchota. The arrangement and classification of the Indian Jassidae has been a most arduous task, as so little pioneer work had been done heretofore in this obscure group. It is hoped, however, that the arrangement adopted, though it may hereafter be subjected to revision, will fulfil the primary object to which all the volumes of the 'Fauna of British India' series are directed, viz. that of enabling students of Natural History in India to recognize and identify the forms of animal life they meet with in the course of their collecting.
